Abstract

Fiber research in concrete construction technology has been helping to prevent catastrophic disasters due to the loss of structural integrity and service life by functioning as structural health monitoring (SHM) technology. Past studies demonstrated the use of self-consolidating carbon nanofiber concrete (SCCNFC) as a structural sensor, which led to the development of carbon nanofiber aggregates (CNFAs) to be used as strain sensors to determine localized strains in concrete structures. This paper examines the effect of temperature and hydration on CNFA-
